

Timelock-Recovery Guide

Electrum Version: 4.5.8 - Plugin Version: 0.1.0

This document will guide you through the process of recovering the funds on wallet: My Trezor Safe 3. The process will take at least 3 days, and will eventually send the following amount to the following address:

- `bc1qht9jx9l524xrl8lvzkucpm6ch9jjshyjk0ag1: 998974. sat`

Before proceeding, MAKE SURE THAT YOU HAVE ACCESS TO THE WALLET OF THIS ADDRESS, OR TRUST THE OWNER OF THIS ADDRESS. The simplest way to do so is to send a small amount to the address, and then trying to send all funds from that wallet to a different wallet. Also important: make sure that the seed-phrase of this wallet has not been compromised, or else a malicious actor could steal the funds the moment they reach their destination.

For more information, visit: <https://timelockrecovery.com>

Step 1 - Broadcasting the Alert transaction

The first step is to broadcast the Alert transaction. This transaction will keep most funds in the same wallet My Trezor Safe 3, except for 600 sats that will be sent to the following address (and can be used in case you need to accelerate the transaction via Child-Pay-For-Parent, as we'll explain later):

- `bc1qht9jx9l524xrl8lvzkucpm6ch9jjshyjk0ag1`

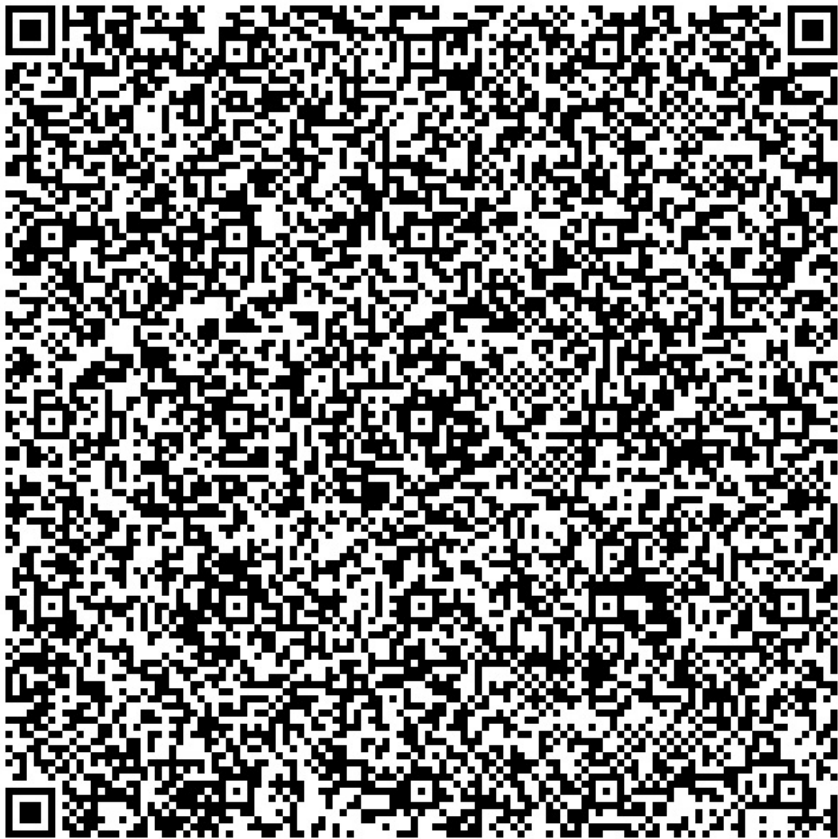

To broadcast the Alert transaction, scan the QR code on the next page and paste the content in one of the following Bitcoin block-explorer websites:

- <https://mempool.space/tx/push>
- <https://blockstream.info/tx/push>
- <https://coinb.in/#broadcast>

You should then see a success message for broadcasting transaction-id:
`8b1a59ba445220d70bb3a5bdc9dd44515f885509e9631fe409a024c483ed73b0`

Step 2 - Waiting for the Alert transaction confirmation

You can follow the Alert transaction via any of the following links:

<https://mempool.space/tx/8b1a59ba445220d70bb3a5bdc9dd44515f885509e9631fe409a024c483ed73b0>

<https://blockstream.info/tx/8b1a59ba445220d70bb3a5bdc9dd44515f885509e9631fe409a024c483ed73b0>

Please wait for a while until the transaction is marked as "confirmed" (number of confirmations greater than 0). The time that takes a transaction to confirm depends on the fee that it pays, compared to the fee that other pending transactions are willing to pay. At the time this document was created, it was hard to predict what a reasonable fee would be today. If the transaction is not confirmed after 24 hours, you may try paying to a Transaction Acceleration service, such as the one offered by: <https://mempool.space.com> . Another solution, which may be cheaper but requires more technical skill, would be to use the wallet that receive 600 sats (address mentioned in Step 1), and send a high-fee transaction that includes that 600 sats UTX0 (this transaction could also be from the wallet to itself). For more information, visit: <https://timelockrecovery.com> .

Step 3 - Broadcasting the Recovery transaction

Approximately 3 days after the Alert transaction has been confirmed, you will be able to broadcast the second Recovery transaction that will send the funds to the final destination, mentioned on the first page. This can be done using the same websites mentioned in Step 1, but this time you will need to scan the QR code on page 4. If this transaction remains unconfirmed for a long time, you should use the Transaction Acceleration service mentioned on Step 2, or use the Child-Pay-For-Parent technique.
